Next.js 톺아보기

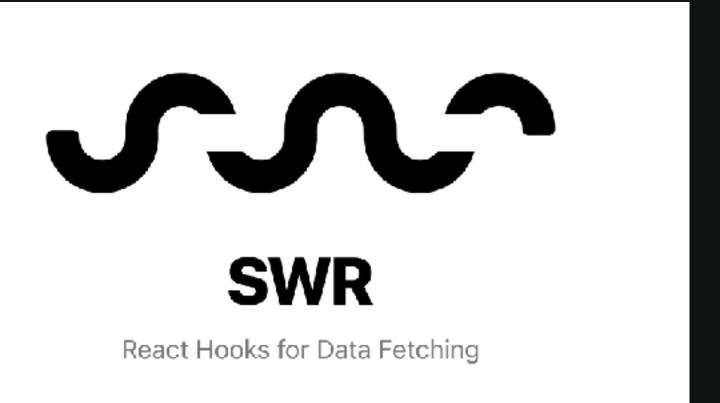

The React Framework for Web

1.

AVercel

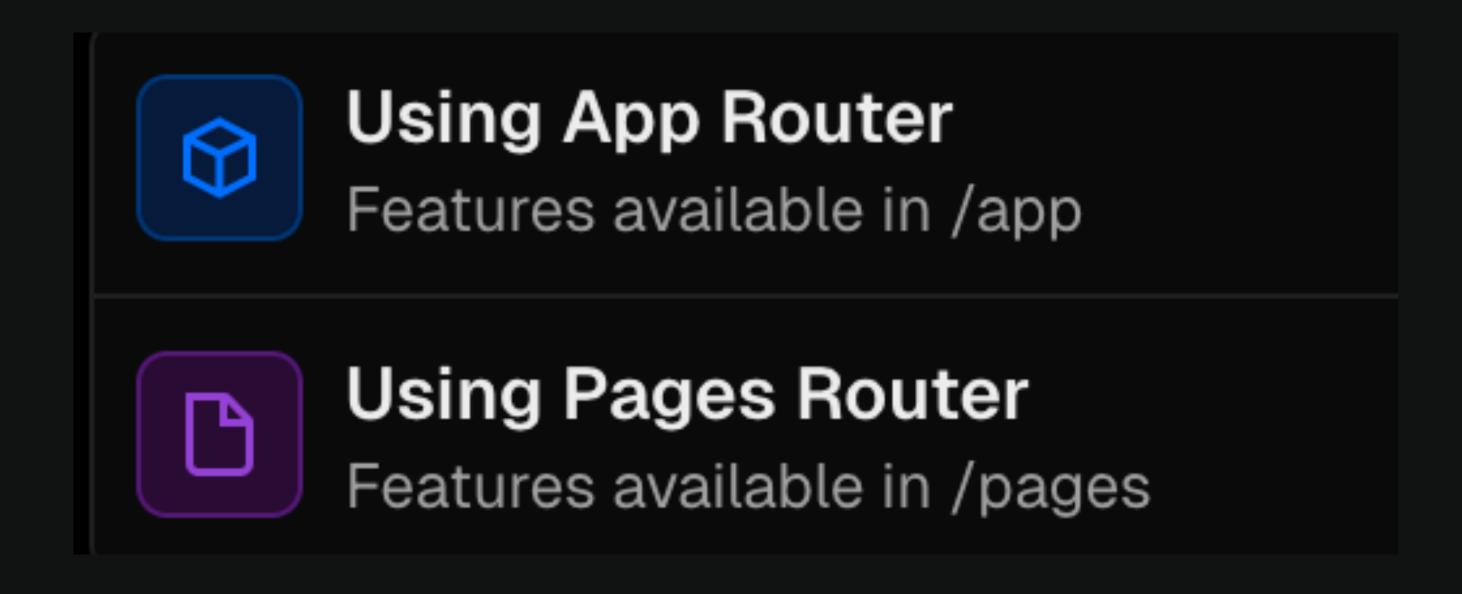

1. Vercel

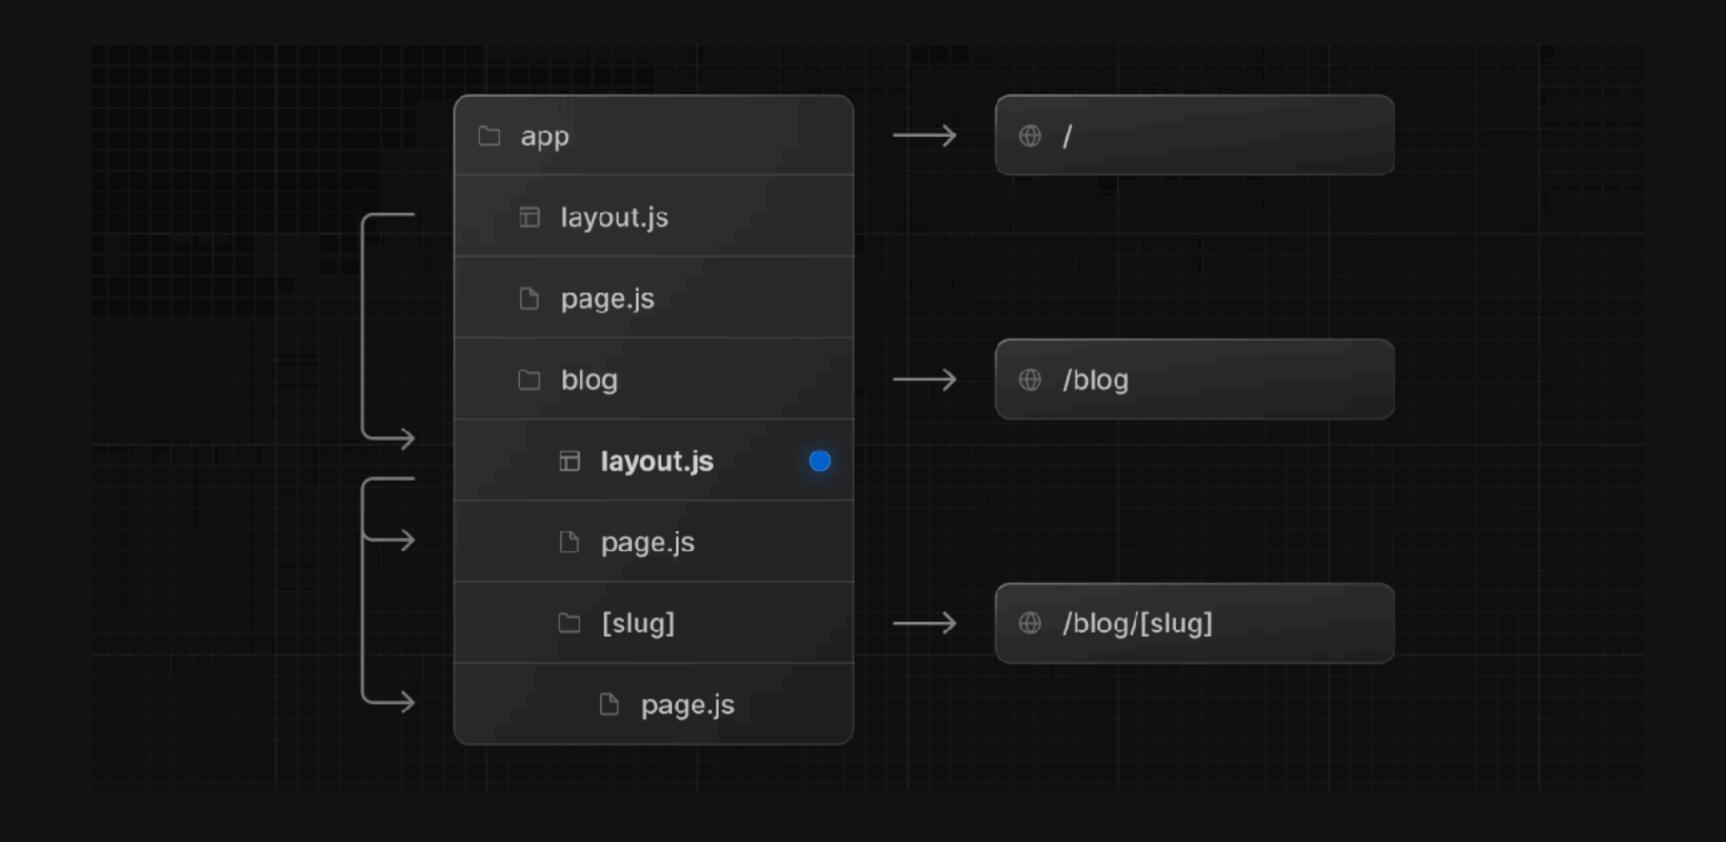

1) file-system based routing

pages router: 파일명을 기준으로 라우팅 (p.301 참고)

```
pages/index.js → /
pages/blog/index.js → /blog
pages/blog/first-post.js → /blog/first-post
pages/dashboard/settings/username.js \rightarrow /dashboard/settings/username
pages/posts/[id].js, then it will be accessible at posts/1, posts/2, etc.
```

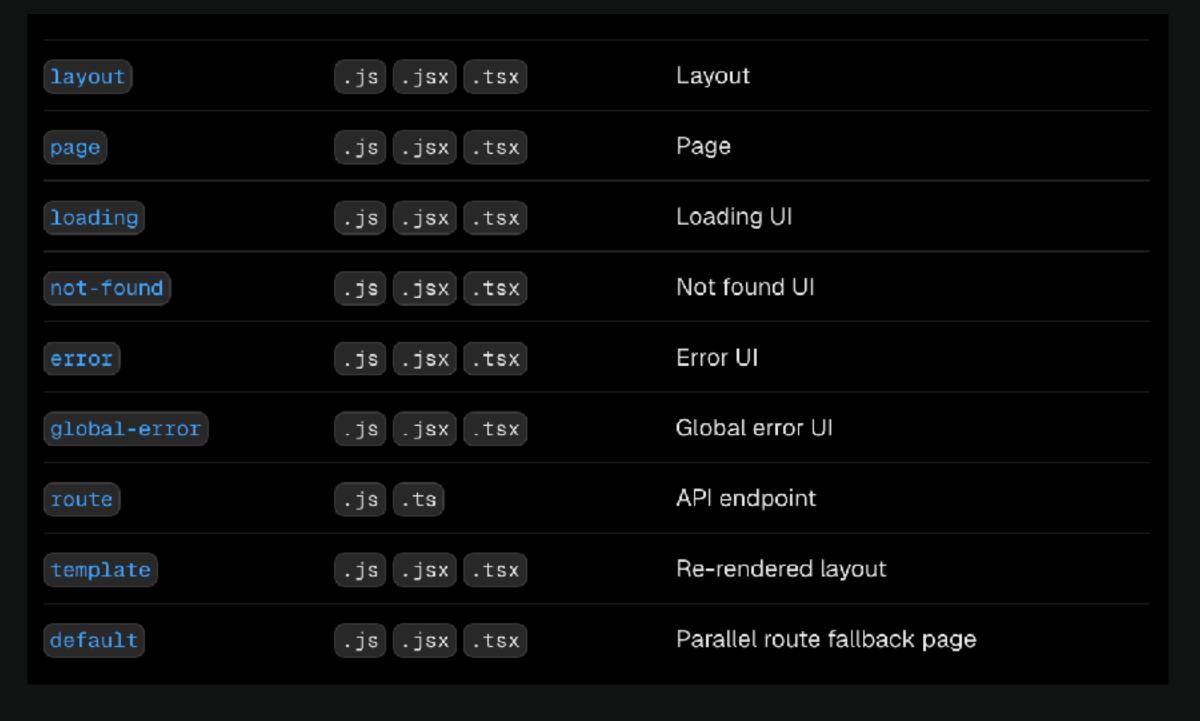

app router: 폴더명을 기준으로 라우팅 (p.719 참고)

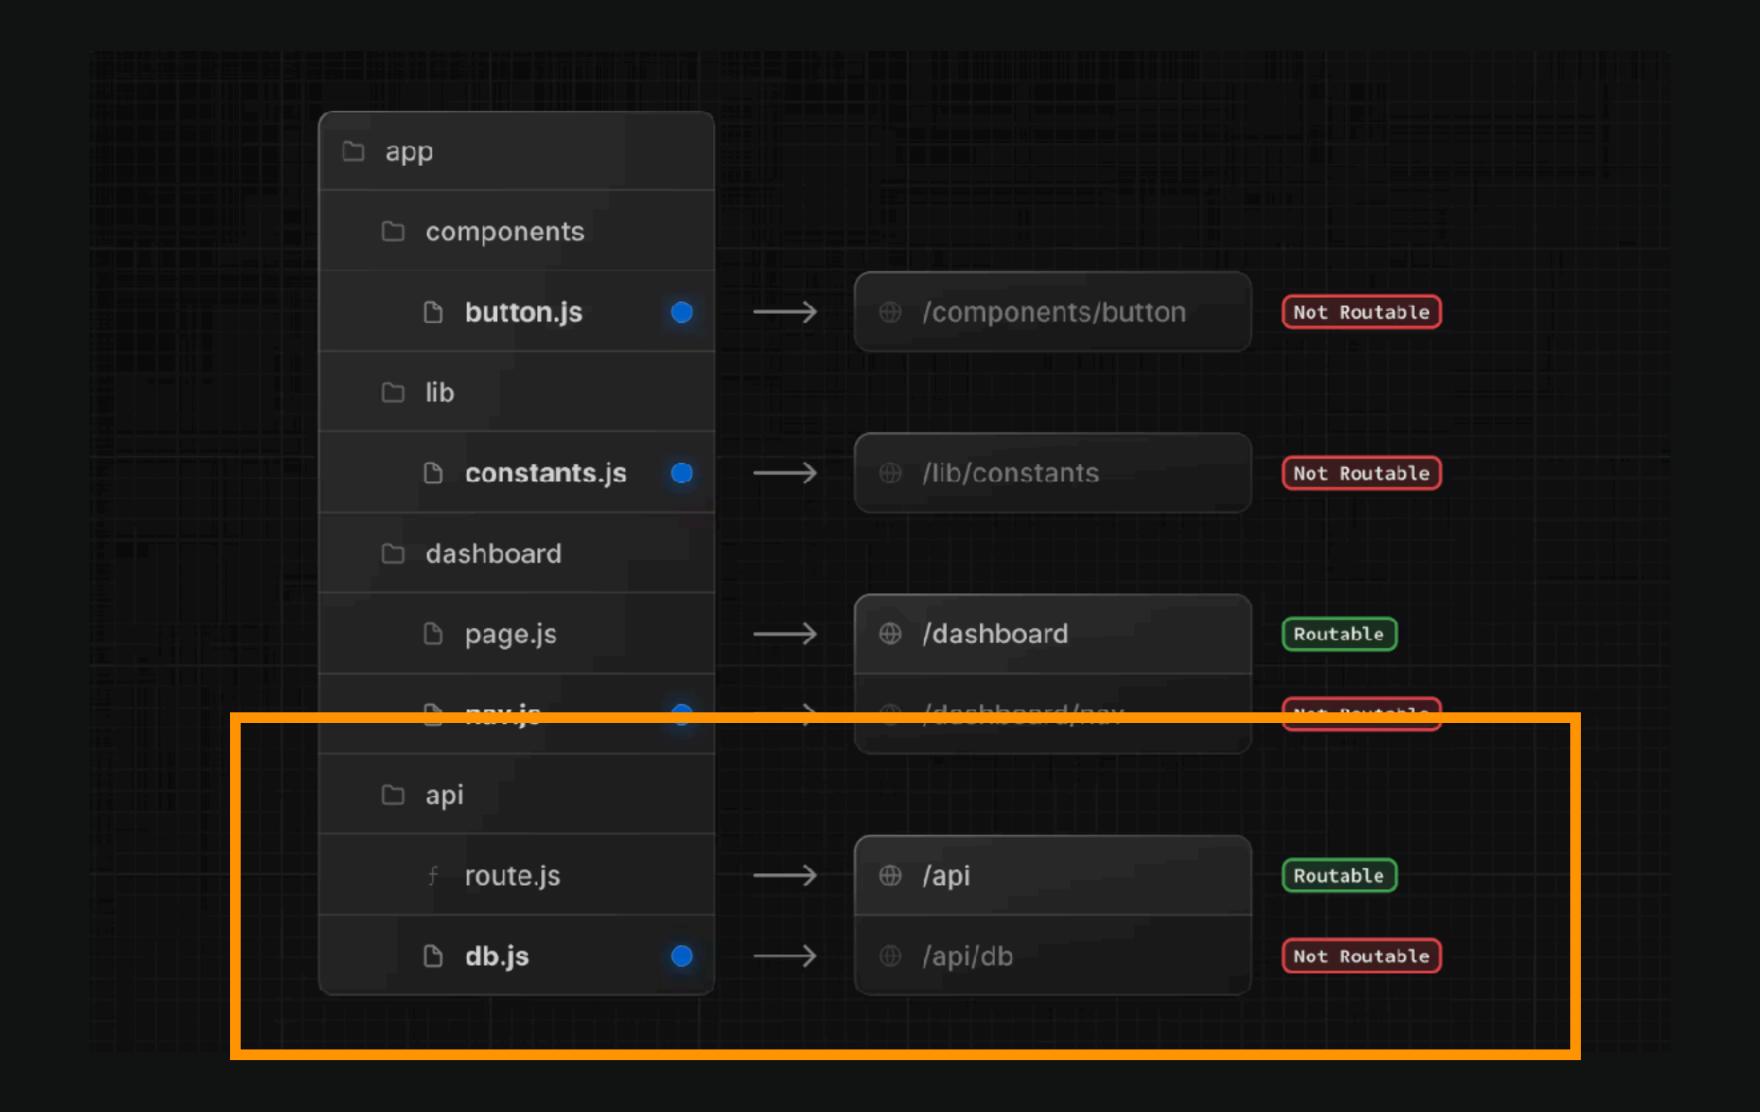

file convention: 해당 이름으로 설정하면 Next.js가 알아서 렌더링

pages router

app router

api route

2) Data Fetching

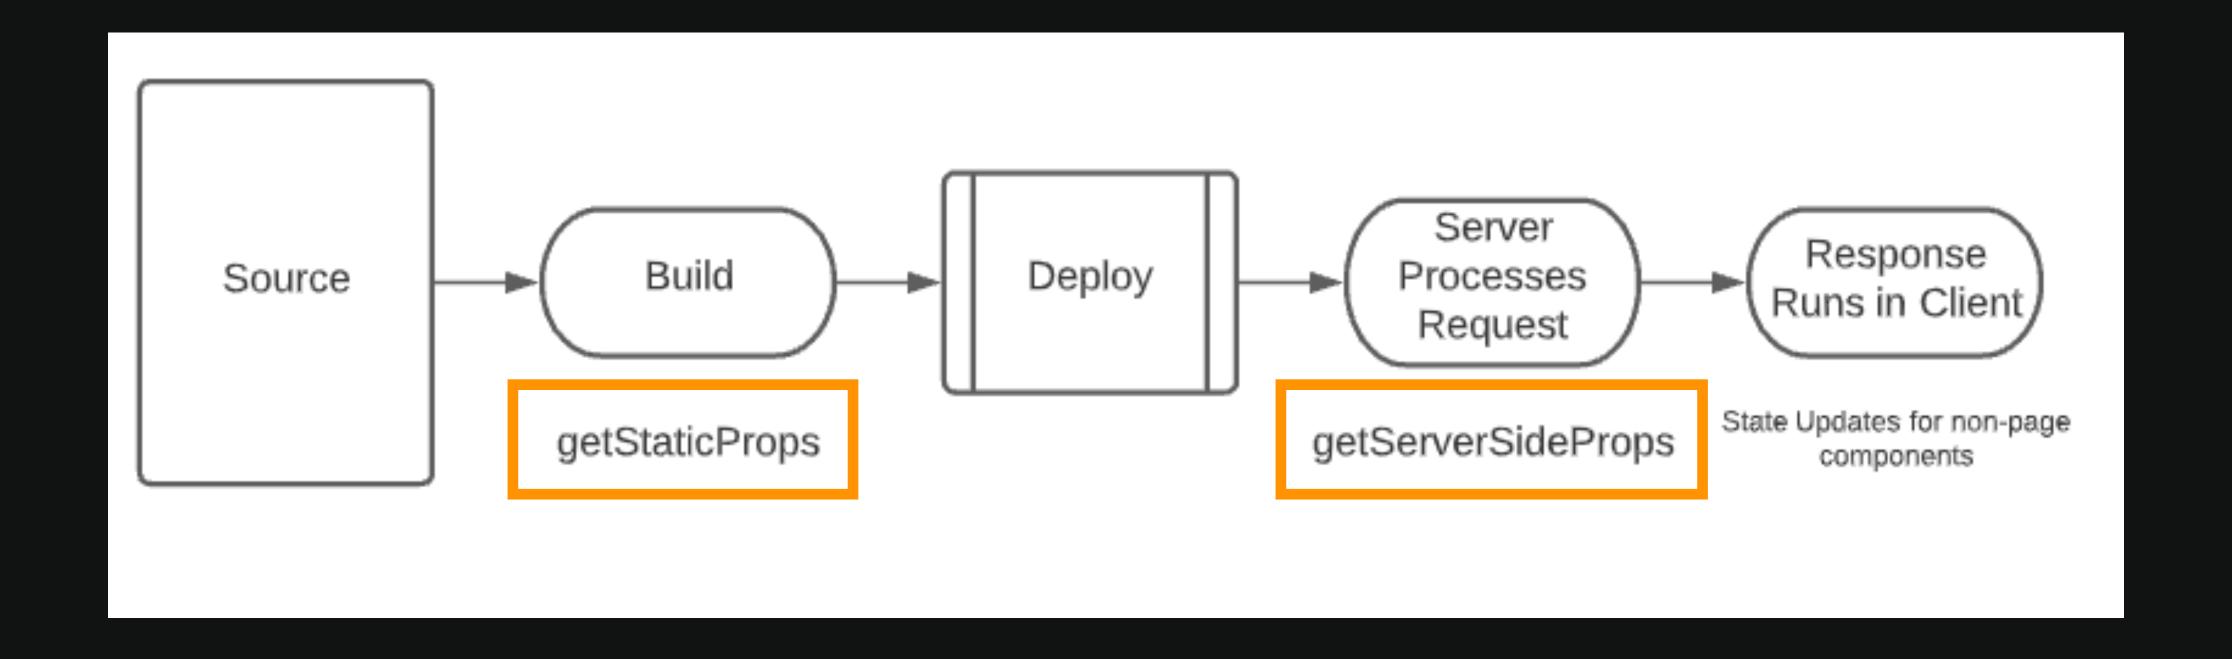

pages router: getStaticPaths와 getStaticProps 그리고 getServerSideProps 사용

- getStaticPaths: 동적 경로를 정의하여 정적으로 생성할 페이지 결정
- getStaticProps: 정적 페이지에 필요한 데이터를 가져오기
- => 두 함수를 통해 빌드 시점에 이미 페이지에 fetching

- getServerSideProps: 페이지에 필요한 데이터를 가져오기
- => 클라이언트가 요청할 때 마다 페이지에 fetching

getStaticProps vs getStaticProps

* getInitialProps: 클라이언트와 서버 모두에서 실행 가능 (legacy)

```
1 const App = () => <h1>This is a NextJS app.</h1>;
2
3 App.getInitialProps = async (ctx) => ({
  isServer: ctx.hasOwnProperty('req'),
5 });
```

app router: generateStaticParams와 fetch 사용

- generateStaticParams: getStaticPaths와 같은 역할
- fetch: 페이지에 필요한 데이터를 가져오기

=> 두 함수를 조합해서, 페이지에 데이터를 전달 (서버 사이드 렌더링)

3) Styling

4) Optimizing Images

```
Js app/page.js
     import Image from 'next/image'
 2
     export default function Page() {
       return (
 4
 5
         <Image
           src="https://s3.amazonaws.com/my-bucket/profile.png"
 6
           alt="Picture of the author"
           width={500}
 8
           height={500}
 9
         />
10
11
```

4) Optimizing Images

Cumulative Layout Shift (CLS)

4) Optimizing Images

priority

```
G
Js app/page.js
     import Image from 'next/image'
 2
     export default function Home() {
       return (
         <>
           <h1>My Homepage</h1>
           <Image
             src="/me.png"
             alt="Picture of the author"
             width={500}
10
             height={500}
11
12
             priority
13
           >Welcome to my homepage!
14
15
         </>
16
17
```

4) Optimizing Images

반응형

```
import Image from 'next/image'
                                                                          Ç
    import mountains from '../public/mountains.jpg'
    export default function Fill() {
      return (
        <div
          style={{
 8
            display: 'grid',
            gridGap: '8px',
 9
            gridTemplateColumns: 'repeat(auto-fit, minmax(400px, auto))',
10
          }}
11
12
13
          <div style={{ position: 'relative', height: '400px' }}>
14
            <Image
15
              alt="Mountains"
16
17
              fill
              sizes="(min-width: 808px) 50vw, 100vw"
18
19
              styre={{
20
                objectFit: 'cover', // cover, contain, none
21
              }}
22
            />
23
          </div>
24
          {/* And more images in the grid... */}
25
        </div>
26
27 }
```
